AFRICOTE®

"Original coatings for Africa"

EST. 1990

INTRODUCTION

Rock art and cave painting across Africa serves as proof of our indigenous ancestors desire and passion to express individuality through creativity. Early cave dwellers became paint pioneers when they perfected the process of identifying and extracting naturally occurring dyes from vegetation and iron oxides from rock formations and mixing it with water and finely crushed plant matter, before painting onto cave walls.

We at Africote®, strive to encapsulate this natural essence, by incorporating into our products the very ingredients, that Mother Earth continues to offer today, as she did then. In addition, Africote® utilizes the latest modern coatings technology and an advanced manufacturing facility to produce a leading range of cementitious and conventional coatings. Africote® employs experts in the areas of developing, testing and new applications of products. For the home owner, designer or architect, who desires to add value to his or her residence or commercial building, whether for interiors or exterior applications, Africote's® marketing team not only stands ready to assist with innovation and diversity, but also ensures the same high level of service is offered at all levels, from the individual customer to product managers of large construction sites.

We are extremely mindful of damage to the environment, which can be caused by VOC's (Volatile Organic Compounds), toxic metals and other harmful substances, as found in traditional coatings. We strive to continue with the development and production of eco-friendly product ranges, limiting VOC's and wherever possible, use recyclable materials in our product formulations. Several of our acrylic coatings are considered eco-friendly due to their low VOC levels, being below 200 grams per litre. Our Cement Naturals and Kolorcote-T coatings are considered zero VOC products and are therefore extremely eco-friendly. Africote® is passionate about the well-being of our planet and is a proud member of the Green Building Council.

AFRICOTE® WALL PLASTERS AND RENDERINGS

ROMAN PLASTER

Roman Plaster is a versatile, colour pigmented cement plaster designed to produce a unique, rustic, Tuscan finish on interior and exterior walls. Formulated to accommodate plaster thickness tolerances of up to 8mm. An experienced Africote applicator can create cosmetic colour variations, hairline surface cracks and blemishes by implementing subtle trowel techniques during the “wet plaster” application stage. During the “damp” stage, Roman Plaster can be cut and sculptured to e.g. replicate masoned stone blocks. Roman Plaster is available in 24 standard colours and can be over coated with a maintenance free Africote specified UV resistant clear sealer.

Roman Plaster is suitable for interior and exterior finishes and although smooth to the touch it creates a unique Tuscan ambience.

ROMAN PLASTER

Coloured Interior and Exterior Plaster

Roman Plaster is suitable for interior and exterior finishes and creates a smooth, rustic finish in various colours.

Roman Plaster combines well with natural stone cladding and wall features to achieve a Sicilian rustic appearance.
