

## **Repello Horses Spray Trials Equestri Guard Horse and Stable Spray**

### **MITES**

Many horses suffer, around this time of year, being cold, dry and windy, from irritable itchy skin which causes the horses to rub and scratch their tails, manes and faces against any object they can find that is convenient. This leads to balding patches, loss of main and loss of tail hairs and makes the horses appear unsightly as well as causing aggravation.

During our trials, over the first seven days, we found that our horses that had been scratching and rubbing themselves raw, especially the tail and mane areas, stopped scratching after the second application. The hair in these areas has since started growing back.

On noticing the above, we have now been applying the product by means of a sponge or cloth to the faces of the horses including the ears and under the jaw. This has been done twice up to now and there is a definite reduction in irritation noticed by the fact that the horses are not rubbing their faces as much as they did prior to testing.

During the first seven days, Robe was taken to a clinic together with many horses from around South Africa, where he was put into an enclosed area of 25 square meters. The other horses were put into similar type enclosures. Subsequent to the clinic a number of horses were found to be severely infested with mites. We had given all participants samples of our product. After hearing of complaints from various owners of the horses conditions the following day (they had rubbed and scratched themselves raw) we convinced them to use the samples given to them on their dear, beloved horses. Within two applications all the horses had stopped rubbing and scratching themselves.

Robe, our horse, had no symptoms of the mites even though after testing we found that his enclosure was mite infested. We can only conclude from this that due to the fact that he had been sprayed, and the mites did not attack him, that the product is a powerful and effective repellent for mites, as well as ticks.

After the successful use of this product on various horses that attended the clinic, we now have some very excited and confident users of our product, especially when it is considered that there is no natural product in the market place that is as effective as this. Even well known chemically based competitive brands do not offer this sort of protection.

We are in the process of testing the product on a dog that has mange so badly that it is suppurating. The vets have all but given up on this dog after trying many different products, but all to no avail. The owners have been given a sample of the product and initial reports are that the dog is a lot more comfortable and we await further reports. See the Forum page at [www.repello.com](http://www.repello.com) for further news and updates.
